## TASK:6

Solve a **Map Coloring problem** using constraint satisfaction approach by applying following constraints

**Aim:** To Solve a Map Coloring problem using constraint satisfaction approach using Graphonline and visualago online simulator

## Algorithm:

**Step 1:** Confirm whether it is valid to color the current vertex worth the current color (by checking whether any of its adjacent vertices are colored with the same color)

Step 2: If yes then color it and otherwise try a different color

Step 3: check if all vertices are colored or not

color[v] = 0

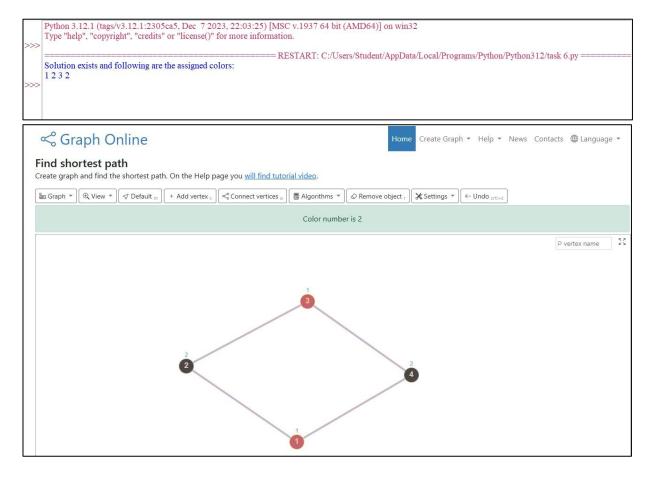

Step 4: If not then move to the next adjacent uncolored vertex

Step 5: Here backtracking means to stop further recursive calls on adjacent vertices.

```
Program: class
Graph:
  def _init_(self, vertices):
     self.v = vertices self.graph = [[0 for column in range(vertices)] for row in
     range(vertices)]
  # A utility function to check if the current color assignment is safe for vertex v def
  is safe(self, v, color, c):
     for i in range(self.v):
       if self.graph[v][i] == 1 and color[i] == c:
          return False
     return True
  # A recursive utility function to solve m-coloring problem def
  graph color util(self, m, color, v):
     if v == self.v: return
       True
     for c in range(1, m+1):
       if self.is safe(v, color, c):
          color[v] = c
          if self.graph_color_util(m, color, v+1):
             return True
```

```
def graph coloring(self, m):
                                                                                                                                                                                     self.v if
                                  color
                                                                                                                   [0]
                                                                                                                                                                                                                                                                          not

                  g.graph_coloring(m)
```

## **Output:**

## **Result:**

Thus Solving a Map Coloring problem using constraint satisfaction approach using Graphonline and visulago online simulator was successfully executed and output was verified.
